1.111.1 Manage users and group accounts and related system files [4]
1.111.2 Tune the user environment and system environment variables [3]
1.111.3 Configure and use system log files to meet administrative and security needs [3]
1.111.4 **Automate system administration tasks by scheduling jobs to run in the future** [4]
1.111.5 Maintain an effective data backup strategy [3]
1.111.6 Maintain system time [4]
Description of Objective

1.111.4 Automate system administration tasks by scheduling jobs to run in the future

Candidate should be able to use cron or anacron to run jobs at regular intervals and to use at to run jobs at a specific time. Task include managing cron and at jobs and configuring user access to cron and at services.
**111.4 Scheduling jobs [4]**

**Key files, terms and utilities**

- `crontab`
- `at`
- `atq`
- `/etc/anacrontab`
- `/etc/at.deny`
- `/etc/crontab`
- `/etc/at.allow`
- `/etc/cron.allow`
- `/etc/cron.deny`
- `/var/spool/cron/*`
Automate system administration tasks by scheduling jobs to run in the future.

Angus Lees

**Introduction**

- **at** – Run a command once
- **cron** – Run a command periodically
The `at` command

`at` takes a time and a list of commands to run. Any output to `STDOUT` or `STDERR` will be mailed to the user running `at`.

```
$ at 2pm
warning: commands will be executed using /bin/sh
at> date
at> ^D
job 3 at 2002-05-08 14:00
```
The **at** command

The current umask, working directory and environment (except for TERM, DISPLAY and _) are saved and restored before running the job (unlike **cron**).

The commands to run will be read from STDIN or from a file given with **-f**.

Example at time specifications

at allows a very flexible time format.

17:36 Run at 5:36pm today or tomorrow.
9pm May 8 Run at 9pm on May 8th.
noon tomorrow Run at 12pm tomorrow.
now + 2 hours Run in 2 hours.

See at(1) for more details.
Queued jobs

`atq` lists a user’s pending jobs.

```
$ atq
3 2002-05-08 14:00 a gus
```

```bash
$ atrm 3  # removes the queued job.
```

```bash
$ at -c 3  # dumps the job on STDOUT.
```

**crond** is a daemon that reads everyone’s **crontab** information, spawning new tasks at the appropriate times.

**crontab** *file* Replace your crontab file with *file*.

**crontab** *-l* List your crontab.

**crontab** *-r* Remove your crontab.

**crontab** *-e* Edit your crontab (with $EDITOR).

A few extra issues arise when editing `/etc/crontab` (and similar “system” crontab files):

- Don’t use `crontab -e`, edit `/etc/crontab` directly.
- A new column (after timespec, before command) gives the user to the command run as.
- Distributions often create directories for “common” frequencies. It usually makes much more sense to place a script in there, rather than adding your own crontab lines. Debian, Red Hat runs any scripts in `/etc/cron.{daily,weekly,monthly}` — but these are triggered from normal entries in `/etc/crontab`, so there’s no real mystery here.
- `/etc/cron.d/*` is read in addition to `/etc/crontab` (they also have the extra user field).

Apparently some people turn their machines off.

If your computer is always turned off at night (for example), then daily jobs which are usually scheduled to run in the wee hours, will never be run. This is a problem.

anacron fixes this by running any missed jobs after a reboot (or other times, like AC-on for laptops).

anacron configuration:

License Of This Document
Since anacron can’t use the crontab files, it has its own simplified /etc/anacrontab.

If you only use the standard /etc/cron.daily, monthly, weekly, then no further configuration will be necessary. Otherwise, see anacrontab(5).

*Note that the frequency of anacron jobs can only be specified in days.*
