SNM — ver. 1.4

Focus: Basics and Standard Tools

- Solving network problems depends a lot on your understanding
- Simple tools can tell you what you need to know
- Example: ping is incredibly useful!

SNM — ver. 1.4

Network Troubleshooting - p. 3/13

Troubleshooting: Learn as you go

- Study and be familiar with the normal behaviour of your network
- Monitoring tools can tell you when things are wrong
 - if you know what things look like when they are right
- Using tools such as Ethereal can help you understand
 - your network, and
 - TCP/IP— better

Troubleshooting

- Avoid it by:
 - redundancy
 - documentation
 - training
- Try quick fixes first
 - simple problems often have big effects:
 - is the power on?
 - is the network cable plugged into the right socket? Is LED flashing?
 - has anything changed recently?
- Change only one thing at a time
 - test thoroughly after the change
- Be familiar with the system
 - maintain documentation
- Be familiar with your tools
 - hefore trouble strikes

Network Troubleshooting - p. 4/134

Documentation

- Maintain an inventory of equipment and software
 - a list mapping MAC addresses to machines can be very helpful
- Maintain a change log for each major system, recording:
 - each significant change
 - each problem with the system
 - each entry dated, with name of person who made the entry
- Two categories of documentation:
 - Configuration information
 - describes the system
 - use system tools to obtain a snapshot, e.g., sysreport in Red Hat Linux
 - Procedural information
 - How to do things
 - use tools that automatically document what word ware 19-p. 6/134

Documentation Tools

- Use script:
 - \$ script ~/logs/logfile-\$(date +%F-%R).log
 - starts a new shell
 - all you type, all output goes into the file
 - Add comments with # I tried this...
- Use tee:
 - \$ arp -a | tee outfile
- Use sudo: all commands are recorded in /var/log/secure
- Use plod from

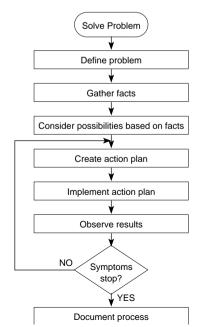

SNM — ver. 1.4

http://bullwinkle.deer-run.com/~hal/plod/

- lets you record a worksheet easily
- Perl, so fine on any platform

SNM — ver. 1.4 Network Troubleshooting - p. 7/134

Problem Solving

Network Troubleshooting - p. 9/134

General Troubleshooting

SNM — ver. 1.4

Network Troubleshooting - p. 8/134

Identify the Problem

- Problem is reported by a person or by software
- Often involves communicating with others
 - Somewhat like gathering requirements in software design
 - An iterative process
- Possible questions to ask:
 - What does not work?
 - What does work?
 - Are the things that do and do not work related?
 - Has the thing that does not work ever worked?
 - When the problem was first noticed?
 - What has changed since the last time it did work?
 - Did anything unusual happen since the last time it worked?
 - When exactly does the problem occur?
 - Can the problem be reproduced and if so, Provided and Italian and Ital

Gather the Facts

- You probably need to find out more about the problem from other sources, including
 - Asking other people: affected users, network administrators, managers, and other key people
 - Network management systems, such as Nagios http://nagios.org/
 - Tools such as Ethereal, tcpdump, ntop (http://ntop.org/) — see slides starting at §83
 - Server log files
 - Documentation about your servers and network created by local staff
 - Documentation about software and hardware that are provided by the vendors

SNM — ver. 1.4 Network Troubleshooting - p. 11/134

Create an Action Plan

- Start with the most likely
 - ... and those that are easiest to test
- Plan needs to be methodical
- Plan to change only one thing at a time
 - You can then understand the cause of the problem
 - Aim to understand the problem so you can learn from it, solve (or prevent) similar problems in the future
- Aim higher than just removing the symptoms!

Consider Possibilities based on Facts

Using the information you have gathered, try to eliminate some potential problems from your list.

SNM — ver. 1.4

Network Troubleshooting - p. 12/134

Implement Action Plan

- Perform each step carefully
- Test to see if symptoms go away

SNM — ver. 1.4 Network Troubleshooting - p. 13/134 SNM — ver. 1.4 Network Troubleshooting - p. 14/134

Observe Results

- Gather results as you change each variable
- Use same techniques you used in slide 11:
 - Check with the key people
 - Check with your tools

SNM — ver. 1.4 Network Troubleshooting - p. 15/134

Otherwise, Modify Action Plan

- Go back to the steps in slide §13:
 - Modify your action plan, selecting the next most likely action from your list
 - You may have discovered more information in your investigation, so this can help you focus on likely causes.
- If you have exhausted all the items on your list, and cannot think of what else to do:
 - Get help from the vendor
 - Get help from mailing lists
 - Discuss the problem with your network of colleagues (e.g., the people who are now studying with you, but who move on to work in a similar field!)
 - You could even track me down and ask me! Quite a few of my ex-students do.

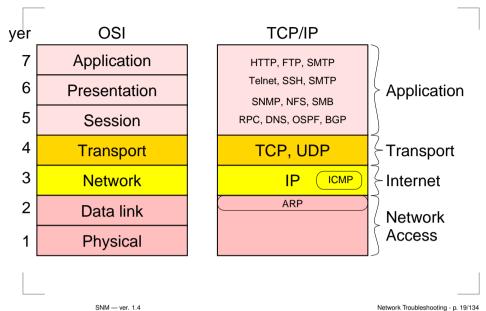

If Solved: Document Solution

- Record the problem and its resolution in the documentation you maintain for your company.
- Ensure others in your team can benefit from the insight you have gained

SNM — ver. 1.4 Network Troubleshooting - p. 16/134

TCP/IP

OSI—TCP/IP

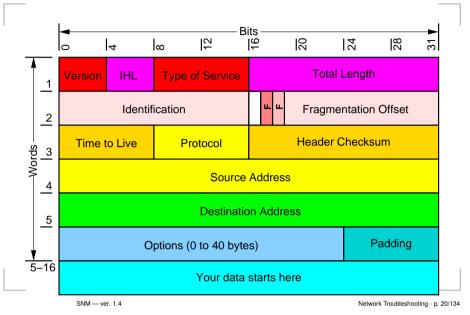

Network Troubleshooting - p. 19/134

IP Header

- Version this is a 4-bit IP header length field that indicates the version of IP currently used. The current version of IP is 4 (IPv4) but IPv6 is already being implemented experimentally and will be supported on future versions of the IOS.
- IP Header Length (IHL) this indicates the datagram header length in 32-bit words.
- Type of Service (ToS) ToS specifies how a particular upper-layer protocol would like the current datagram to be handled. Datagrams can be assigned various levels of importance with this field.
- Total length this specifies the length of the entire IP packet, including data and header, in bytes.
- Identification this field contains an integer that identifies the current datagram. This field is used to help niaca togathar datagram fragments

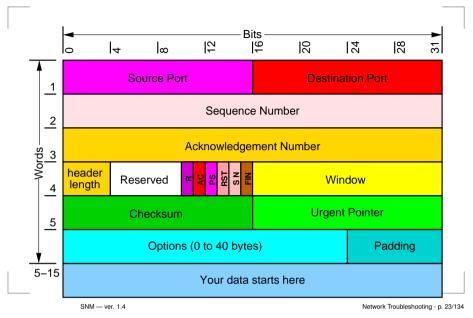

IP Header—Layer 3

IP Header (continued)

- Flags a flag is a 3-bit field of which the 2 low-order bits control fragmentation. One bit specifies whether the packet can be fragmented; the second bit specifies whether the packet is the last fragment in a series of fragmented packets.
- Time-to-Live this field maintains a counter that gradually decrements down to zero, at which point the datagram is discarded. This prevents packets from looping endlessly.
- Protocol protocol indicates which upper-layer protocol receives incoming packets after IP processing is complete.
- Header Checksum this field helps ensure IP header integrity.
- Source Address this field specifies the sending node.

TCP Header—Layer 4

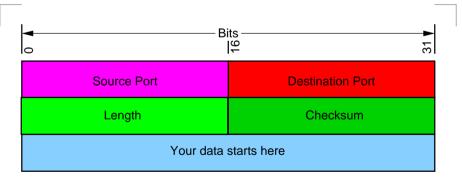

TCP Header (continued)

- Window this field specifies the size of the sender's receive window (that is, buffer space available for incoming data).
- Checksum this field indicates whether the header was damaged in transit.
- Urgent pointer this field points to the first urgent data byte in the packet.
- Options this field specifies various TCP options.
- Data this field contains upper-layer information.

TCP Header

- Source port and destination port these fields identify the points at which upper-layer source and destination processes receive TCP services.
- Sequence number this field usually specifies the number assigned to the first byte of data in the current message. Under certain circumstances, it can also be used to identify an initial sequence number to be used in the upcoming transmission.
- Acknowledgment number this field contains the sequence number of the next byte of data the sender of the packet expects to receive.
- Data offset this field indicates the number of 32-bit words in the TCP header.
- Reserved this field is reserved for future use.
- Flags this field carries a variety of control information p. 24/134

UDP Header—Layer 4

- Source and Destination Port fields serve the same functions as they do in the TCP header.
- Length field specifies the length of the UDP header and data
- Checksum field allows packet integrity checking. It is optional ver. 1.4
 Network Troubleshoo

Troubleshooting TCP/IP

ver. 1.4 Network Troubleshooting - p. 27/134

Troubleshooting TCP/IP

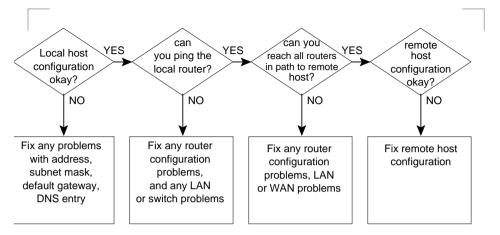

Step 1 First, determine whether your local host is properly configured (for instance, correct subnet mask and default gateway configuration).

Step 2 Next, use the ping or traceroute commands to determine whether the routers through which you must communicate can respond. Start with the most local router and progressively ping outwards through the Internet or use traceroute.

Step 3 If you cannot get through a particular node, examine the node configuration and use the various show commands to determine the state of the router (these include show ip route, show ip arp, show running-configuration, and so on.)

Step 4 If you can get to all the routers in the path, check the _____ host configuration at the remote host (or get someone's -p. 29/134

Troubleshooting TCP/IP

- ver. 1.4 Network Troubleshooting - p. 28/1

Host Network Configuration tools

ps — information about processes
top — dynamic information about processes
netstat — show connections and services, routing
lsof — list open files
ifconfig — shows and changes network interfaces
route — shows, changes routing table
ip — show, change, set network configuration
arp — shows MAC addresses
nmap — portscanner: shows open ports, identifies OS

SNM -- ver. 1.4

Network Troubleshooting - p. 30/134

Checking (and Setting) Host Configuration

- Solving Boot problems: §32, §33
- Determine IP address, netmask, broadcast address: §34
- Deterine correct MAC ↔ IP address mapping: §35, §36
- Examine routing table: §37
- Examine access controls: §38
- Examine web proxy settings: check web browser
- Examine DNS resolver settings: §39
- Determine services provided: §40, §41
- Determine CPU, memory load conditions (is the server overloaded?) §42

Network Troubleshooting - p. 31/134

Boot problems: Windows

- Use the installation Windows CD to enter the (extremely limited) system repair mode. I believe this is called the recovery console.
- Use the Linux floppy bootdisk at http://home.eunet.no/~pnordahl/ntpasswd/to replace the Administrator password
- Use the bootable Windows CDROM:

http://www.nu2.nu/pebuilder/;

- Gives full access to the NTFS file system.
- Not as good with Windows as Knoppix is with Linux, but better than another reinstall.
- takes some time to build.
- Henry Leung (in A204d) has built some.

Boot problems: Linux

Use grub to interactively boot the computer (see my extensive grub handout:

http://nicku.org/ossi/lab/grub/grub.pdf)

- Verify that /etc/fstab mounts the correct filesystems
- Use a rescue disk such as Knoppix or the Red Hat installation CDROM.
- This gives you full access to the system and repairing boot problems is pretty straightforward.

SNM — ver. 1.4

Network Troubleshooting - p. 32/134

Determine Addresses

Linux: On Linux, these commands all show the IP address, MAC address, netmask and broadcast address for all (or the specified) interface. The commands ip and ifconfig are in the directory /sbin; netstat is in /bin.

- \$ ip addr
- \$ ip addr show eth0
- \$ ifconfig
- \$ ifconfig eth0
- \$ netstat -i

Windows:

C:\> ipconfig /all

Cisco IOS: these are both privileged commands, as shown by the prompt:

Router# show running-config

$MAC \leftrightarrow IP mapping - 1$

Linux:

- \$ arp -a
- \$ ip neigh show

The lifetime of the ARP cache entries is settable in $/proc/sys/net/ipv4/neigh/\langle interface \rangle/gc_stale_time and is normally 60 seconds.$

Cisco IOS:

Router# show ip arp

Note that this document:

http://members.cox.net/~ndav1/self_published/The_ARP_cache.doc has a good discussion on troubleshooting ARP.

The online book at http://linux-ip.net/ has an excellent chapter on ARP.

ARP is probably the most dangerously exposed protocol in a 35/134

Routing Table

Linux: The commands ip and route are in /sbin, the command netstat is in /bin.

- \$ ip route
- \$ route -n
- \$ netstat -nr

Windows:

- C:\> route print
- C:\> netstat -nr

Cisco IOS:

Router# show ip route

$MAC \leftrightarrow IP mapping - 2$

Windows:

C:\> arp -a

You may wish to clear the ARP cache on a Windows machine with:

C:\> arp -d \langle IP address \rangle

or clear the entire ARP cache with:

C:\> arp -d *

since the Windows ARP cache lives 10 minutes by default, a rather (too?) long time.

It can be changed by two registry entries under HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters.

SNM — ver. 1.4

Network Troubleshooting - p. 36/134

Access Controls

Access controls can block access mysteriously unless you think to check for it.

Linux: There are two main things to check. The iptables command is in the /sbin directory.

\$ iptables -L -n

Note that Linux and many other POSIX systems implement the tcpwrappers access control in /etc/hosts.allow and /etc/hosts.deny. See man hosts.allow and man hosts.deny.

Cisco IOS:

Router# show ip access-list

DNS resolver settings

Linux: The configuration for the resolver is

/etc/resolv.conf. This determines what name servers the system will ask. It also tells what domain will be appended to a hostname.

The /etc/hosts file is usually the first way hostname \leftrightarrow IP address mappings are made, but this can be changed in /etc/nsswitch.conf. To ask the operating system for what it can see there, do:

\$ getent hosts

Linux provides three tools for troubleshooting DNS and DNS servers: dig, host and nslookup.

Windows: See the output of

C:\> ipconfig /all

for the names of the DNS server the resolver will use.

Recent versions of Windows provide the program.

Using ps to See If Server Running

- Is the network service running on the server?
- Is the web server running?
 - \$ ps aux | grep httpd
- Is the DHCP server running?
 - \$ ps aux | grep dhcpd
- Is the directory server running?
 - \$ ps aux | grep slapd
- Windows: use the task manager

Checking services provided

Linux: There are four main ways to check:

- Verify the processes with ps (see §41)
- Verify the services that are configured to start when the system boots:
 - \$ chkconfig --list | grep on
- Check that the service is listening on the network interface:
 - \$ netstat -tua will show all network connections to this machine.
- The lsof program can be helpful in diagnosing problems with network services. See §44.

Windows: Check network connections with

C:\> netstat -a

SNM - ver. 1.4

Network Troubleshooting - p. 40/13

Using top to see Resource Hogs

- The program top shows:
 - load average (the average number of processes that are ready to run, but for which no CPU is available)
 - a load average of 4 or more is "quite high"
 - processes that use the most resources

SNM — ver. 1.4 Network Troubleshooting - p. 41/134 SNM — ver. 1.4 Network Troubleshooting - p. 42/134

netstat -tua: See Network Connections

- netstat -tua shows all network connections, including those listening
- sudo netstat -tuap shows all network connections, including those listening, and the processes responsible
- netstat -tul shows all network listeners
- netstat -t shows only TCP connections that are established
- netstat -i is like ifconfig, shows info and stats about each interface
- netstat -nr shows the routing table, like route -n
- Windows provides netstat also.

SNM — ver. 1.4

Network Troubleshooting - p. 43/134

ifconfig

- ifconfig eth0 show stats on network interface eth0
- sudo ifconfig lo 127.0.0.1 configure the loopback interface, start it up
- sudo ifconfig eth0 172.19.233.5 netmask 255.255.255.0 — configure eth0 with IP address 172.19.233.5/24
- ifconfig show all configured network interfaces
- ifconfig -a show all interfaces, including those not configured yet.

1sof: List Open Files

- An amazingly useful tool
- Available for almost any Unix system
- lsof -i shows output to Internet and X.25 files, but won't show connections that have terminated
- lsof -i@nicku.org will show only connections to that machine
- Can monitor progress of an FTP transfer, many, many other applications
- See manpage, FAQ and quick start guide.
- Apparently, no equivalent tool available on Windows.

SNM - ver. 1.4

Network Troubleshooting - p. 44/134

route

- route -n print routing table
- route add 127.0.0.1 add a route to localhost;
- should have been done automatically when created device with ifconfig
- route add -net 172.19.233.0 add a route to the eth0 configured on previous slide
- should have been done automatically by ifconfig
- route add 172.19.64.0 gw 172.19.233.254 add a static route to network 172.19.64.0 through router 172.19.233.254
- route add default gw 172.19.233.253 add a default route to 172.19.233.253 through eth0

Connectivity Testing: Cabling

- Label cables clearly at each end
- Cable testers
 - ensure wired correctly, check:
 - attenuation
 - length is it too long?
 - 100BaseT: less than 100m
- Is the activity light on the interface blinking?

Ping

SNM — ver. 1.4

Network Troubleshooting - p. 47/134

Software tools: ping

- Most useful check of connectivity
- Universal
- If ping hostname, includes a rough check of DNS
- Sends an ICMP (Internet Control Message Protocol) ECHO_REQUEST
- Waits for an ICMP ECHO_REPLY
- Most pings can display round trip time
- Most pings can allow setting size of packet
- Can use to make a crude measurement of throughput—see §61

SNM — ver. 1.4

Network Troubleshooting - p. 48/1

What ping Result is Good, Bad?

- A steady stream of consistent replies indicates probably okay
- Usually first reply takes longer due to ARP lookups at each router
 - After that, ARP results are cached
- ICMP error messages can help understand results:
 - Destination Network Unreachable indicates the host doing ping cannot reach the network
 - Destination Host Unreachable may come from routers further away

SNM — ver. 1.4 Network Troubleshooting - p. 49/134 SNM — ver. 1.4 Network Troubleshooting - p. 50/134

How to Use ping?

- Ensure local host networking is enabled first: ping localhost, local IP address
- ping a known host on local network
- ping local and remote interfaces on router
- ping by IP as well as by hostname if hostname ping fails
 - confirm DNS with dig (or nslookup) see slide §118
- Ping from more than one host

VM — ver. 1.4 Network Troubleshooting - p.

hping2: ping anything with anything

- able to send custom TCP/IP packets and
- display target replies like ping program does with ICMP replies.
- Can install with \$ yum -y install hping2 on Fedora Core 1.
- See http://www.hping.org/.

fping: flood ping

- Designed to test a large number of hosts
- more efficient than ping
- Used extensively by monitoring software such as mon: http://www.kernel.org/software/mon/, nagios: http://www.nagios.org/
- take care not to flood too much!
- RPMs are available; I built one (a long time ago) and put it on ictlab under ~ftp/pub/redhat/contrib

SNM — ver. 1.4

Network Troubleshooting - p. 52/134

arping: uses ARP requests

- Limited to local network
- Can work with MAC or IP addresses
- use to probe for ARP entries in router (very useful!)
- packet filtering
 - can block ICMP pings, but
 - won't block ARP requests

SNM — ver. 1.4 Network Troubleshooting - p. 53/134 SNM — ver. 1.4 Network Troubleshooting - p. 54/134

Path Discovery: traceroute

- Sends UDP packets
 - (Microsoft tracert sends ICMP packets)
- increments Time to Live (TTL) in IP packet header
- Sends three packets at each TTL
- records round trip time for each
- increases TTL until enough to reach destination

SNM — ver. 1.4 Network Troubleshooting - p. 55/134

traceroute Limitations

- Each router has a number of IP addresses
- but traceroute only shows the one it used
- get different addresses when run traceroute from other end
- sometimes route is asymmetric
- router may be configured to not send ICMP TIME_EXCEEDED messages
 - get stars: * instead of round-trip time in traceroute output

traceroute: How it Works

- As IP packets pass through each router, TTL in IP header is decremented
- Packet is discarded when TTL decrements to 0
- ROUTER sends ICMP TIME_EXCEEDED message back to traceroute host
- When UDP packet reaches destination, gets ICMP PORT_UNREACHABLE, since uses an unused high UDP port

NM — ver. 1.4 Network Troubleshooting - p. 56/134

Performance Measurements: delay

- Three sources of delay:
- transmission delay time to put signal onto cable or media
 - depends on transmission rate and size of frame
- propagation delay time for signal to travel across the media
 - determined by type of media and distance
- queuing delay time spent waiting for retransmission in a router

SNM — ver. 1.4 Network Troubleshooting - p. 57/134 SNM — ver. 1.4 Network Troubleshooting - p. 58/134

Is Bandwidth == Throughput?

- bandwidth the difference between the upper frequency and the lower frequency that a channel can carry
 - measured in Hertz
- throughput amount of data that can be sent over link in given time
 - is not the same as bandwidth, which really has no direct meaning with digital information
- bandwidth is related to throughput by the Shannon-Hartley Theorem; throughput ∞ bandwidth if signal to noise ratio is fixed:

$$C_{\mathsf{max}} = B \log_2 \left(1 + \frac{S}{N} \right)$$
 bits/sec

where $C_{\sf max} = {\sf maximum}$ channel capacity, Network Troubles

ping Roughly Estimating Throughput

- Example: measuring throughput between this machine and one remote machine.
- ping with packet size = 100 bytes, round-trip time = 30ms
- ping with packet size = 1100 bytes, round-trip time = 60ms
- So takes 30ms extra (15ms one way) to send additional 1000 bytes, or 8000 bits
- Throughput is roughly 8000 bits per 15ms, or about 530,000 bits per second
- A very crude measurement:
 - no account for other traffic, treats all links on path, there and back, as one.
 - Routers sometimes send packets onwards with much higher priority than with which they answer pings. See
 slide §68.

Quality of a Link

- Other measurements needed
 - i.e., for quality of service for multimedia

SNM — ver. 1.4

Network Troubleshooting - p. 60/1

Throughput: ping One Remote Host

This can be expressed as a simple formula:

$$TP=16 imesrac{P_l-P_s}{t_l-t_s}$$
 bits per second, where

 P_l = size of large packet

 $P_s = \text{size of small packet}$

 t_l = round-trip time for large packet

 $t_s =$ round-trip time for small packet

Here we have:

$$TP = 16 \times \frac{1100 - 100}{(60 - 30) \times 10^{-3}}$$

$$= 16 \times \frac{1000}{30 \times 10^{-3}}$$

$$= \frac{16}{30} \times 10^{6}$$

Network Troubleshooting - p. 62/134

Throughput: ping Two Remote Hosts

- Measure throughput between two remote hosts: may use tools like ping
- ping two locations with two packet sizes (4 pings altogether, minimum)
 - Many ping programs calculate average ping time: better to make a number of pings, use the average ping time.
 - First ping time may be longer due to the time to get an answer to the arp request
 - May be better to ping once, then start pinging again, and use the average ping time.
- Example:

Address	RTT 100 bytes	RTT 1100 by	rtes
205.153 _N 61 _{ver.11.4}	1.380 ms	5.805 ms	Network Troubleshooting - p. 63/134

Throughput: ping Two Remote Hosts — 3

$$TP=16 imes rac{P_l-P_s}{t_{fl}-t_{fs}-t_{nl}+t_{ns}}$$
 bits per second

where:

 $P_l = I$ arge packet size, bytes

 $P_s = \mathbf{s}$ mall packet size, bytes

 $t_{nl} = \text{ping time for } \textbf{\textit{I}}$ arger packet to the $\textbf{\textit{n}}$ ear link, seconds

 t_{ns} = ping time for **s**maller packet to the **n**ear link, seconds

 $t_{fl} = \text{ping time for } I \text{arger packet to the } I \text{ ar link, seconds}$

 t_{fs} = ping time for **s**maller packet to the **f**ar link, seconds

Throughput: ping Two Remote Hosts — 2

Address	RTT 100 bytes	RTT 1100 bytes
205.153.61.1	1.380 ms	5.805 ms
205.153.60.2	4.985 ms	12.823 ms
165.166.36.17	8.621 ms	26.713 ms

- Time difference / 2 (round trip time (RTT) → one way)
- Divide by size difference in bits: $8000 = 8 \times (1100 100)$
- Multiply by 1000 (ms → seconds)
- Mbs = bps/ 10^6

Near link	Far link	Time difference	Est. Throughput
205.153.61.1	205.153.60.2	3.413 ms	4.69 Mbps
205.153.60.2	165.166.36.17	10.254 ms	1.56 Mbps

 3.413^{s} m/s $= (12.823 - 4.985) - (5.805 - 1.380^{\text{s}})$ m/s

Throughput: ping Two Remote Hosts — 4

$$\begin{split} P_l &= \textit{l} \text{arge packet size, bytes} = 1100 \, \text{bytes} \\ P_s &= \textit{small packet size, bytes} = 100 \, \text{bytes} \\ t_{nl} &= \text{ping time for } \textit{l} \text{arger packet to the } \textit{n} \text{ear link, seconds} \\ &= 5.805 \times 10^{-3} \, \text{seconds} \\ t_{ns} &= \text{ping time for } \textit{smaller packet to the } \textit{n} \text{ear link, seconds} \\ &= 1.380 \times 10^{-3} \, \text{seconds} \\ t_{fl} &= \text{ping time for } \textit{l} \text{arger packet to the } \textit{f} \text{ar link, seconds} \\ &= 12.823 \times 10^{-3} \, \text{seconds} \\ t_{fs} &= \text{ping time for } \textit{smaller packet to the } \textit{f} \text{ar link, seconds} \\ &= 4.985 \times 10^{-3} \, \text{seconds} \\ TP &= 16 \times \frac{P_l - P_s}{t_{fl} - t_{fs} - t_{nl} + t_{ns}} \quad \text{bits per second} \\ &= 16 \times \frac{1100 - 100}{(12.823 - 4.985 - 5.805 + 1.380) \times 10^{-3}} \quad \text{bits per second} \\ &= 16 \times \frac{1000}{3.413 \times 10^{-3}} \\ &\approx 4.687.958 \\ &\approx 4.69 \, \text{Megabits per second} \end{split}$$

Throughput: ping Two Remote Hosts — 5

```
P_l = \textit{l} \text{arge packet size, bytes} = 1100 \, \text{bytes} P_s = \text{small packet size, bytes} = 100 \, \text{bytes} t_{nl} = \text{ping time for \textit{l} arger packet to the \textit{n} ear link, seconds} = 12.823 \times 10^{-3} \, \text{seconds} t_{ns} = \text{ping time for \textit{smaller packet to the \textit{n} ear link, seconds} = 4.985 \times 10^{-3} \, \text{seconds} = 4.985 \times 10^{-3} \, \text{seconds} t_{fl} = \text{ping time for \textit{l} arger packet to the \textit{f} ar link, seconds} = 26.713 \times 10^{-3} \, \text{seconds} t_{fs} = \text{ping time for \textit{smaller packet to the \textit{f} ar link, seconds} = 8.621 \times 10^{-3} \, \text{seconds} = 8.621 \times 10^{-3} \, \text{seconds} t_{fl} = 16 \times \frac{P_l - P_s}{t_{fl} - t_{fs} - t_{nl} + t_{ns}} \, \text{bits per second} = 16 \times \frac{1100 - 100}{(26.713 - 8.621 - 12.823 + 4.985) \times 10^{-3}} \, \text{bits per second} = 16 \times \frac{1000}{10.254 \times 10^{-3}} \times 1.560,366 \approx 1.56 \, \text{Megabits per second}
```

Network Troubleshooting - p. 67/134

– ver. 1.4

Path Performance: Other tools

- Could use a tool like pathchar, bing, clink, pchar, or tmetric that performs this calculation for you
- Use http://www.google.com/ to locate these tools
- pathchar is only available in binary form
- Others in source form, need compile with commands something like this:
 - \$ cd bing-1.1.3
 - \$ make
 - \$ sudo make install

Limitations of measuring with ping

- Most modern routers give high priority to routing
 - Expecially switching routers, such as the Cisco 6509 in our Campus
 - Many give much lower priority to answering pings
 - The difference can be so great that the ping reply sometimes comes sooner from a more distant router, which according to our formula, indicates a negative throughput!
 - Do not blindly apply this formula!
- Measurements may not match the kind of traffic created by the application you support
- The big advantages of these ICMP measurements are:
 - you do not need access to the machines, and
 - you do not need to install any special software on them.

M — ver. 1.4 Network Troubleshooting - p. 68/134

Path measurement with pathchar

```
$ sudo ./pathchar sina.com.hk
pathchar to sina.com.hk (202.85.139.140)
 can't find path mtu - using 1500 bytes.

```

Measuring Throughput

- May use ftp to transfer a large file, measure time
 - tests whole path
 - problem: affected by disk I/O, xinetd
- May use a web browser and measure download time
 - Problem: may be affected by caching in the web browser
 - May be affected by caching in web proxies
- Better: measure using traffic similar to that created by the application.

SNM — ver. 1.4 Network Troubleshooting - p. 71/134

iproute

Measuring Throughput with ttcp

- Use ttcp, not affected by disk I/O
- Consists of a client and server
- Need have installed at both ends
- Part of Red Hat Linux, Cisco IOS
- Example: first, start receiver on ictlab:

```
$ ttcp-r -s
ttcp-r: buflen=8192, nbuf=2048, align=16384/0, port=5001 tcp
ttcp-r: socket
ttcp-r: accept from 172.19.32.30
ttcp-r: 16777216 bytes in 1.45 real seconds = 11285.88 KB/sec +++
ttcp-r: 9704 I/O calls, msec/call = 0.15, calls/sec = 6684.46
ttcp-r: 0.0user 0.2sys 0:01real 14% 0i+0d Omaxrss 0+2pf 0+0csw
```

Second, start transmitter on nickpc:

```
$ ttcp -t -s ictlab
ttcp-t: buflen=8192, nbuf=2048, align=16384/0, port=5001 tcp -> ictlab
ttcp-t: socket
ttcp-t: connect
ttcp-t: 16777216 bytes in 1.45 real seconds = 11335.64 KB/sec +++
ttcp-t: 2048 I/O calls, msec/call = 0.72, calls/sec = 1416.95
SNM -ver.14
ttcp-t: 0.0user 0.0sys 0:01real 4% 0i+0d 0maxrss 0+2pf 0+0csw
```

The ip program, iproute

- The ip program in the iproute package provides complete control over TCP/IP networking in a Linux system
- Provides more networking control facilities than other TCP/IP implementations
- Supports tunneling in many forms
- iproute documentation is in two manuals, one for IP routing, the other for tunnelling

SNM — ver. 1.4 Network Troubleshooting - p. 73/134 SNM — ver. 1.4 Network Troubleshooting - p. 74/134

iproute and iptables

- Between these software packages, you can:
 - throttle bandwidth for certain computers
 - throttle bandwidth to certain computers
 - fairly share bandwidth
 - protect your network from DoS attacks
 - protect Internet from your customers
 - multiplex many servers into one, for load balancing or for high availability
 - restrict access to your computers
 - limit access of your users to other hosts
 - do routing based on user id, MAC address, source IP, port, type of service, time of day or content
- See the Linux Advanced Routing and Traffic Control HOWTO at http://tldp.org for details

SNM — ver. 1.4 Network Troubleshooting - p. 75/134

Measuring Traffic: netstat -i

Here we run netstat -i on ictlab:

- Notice that of the 1.6 billion bytes transmitted, there were 3 overuns.
- Next, blast the path you want to test with packets using ping -1 or the spray program, and measure again.

Traffic Measurements: netstat -i

- The netstat program can show statistics about network interfaces
- Linux netstat shows lost packets in three categories:
 - errors.
 - drops (queue full: shouldn't happen!)
 - overruns (last data overwritten by new data before old data was read: shouldn't happen!)
 - drops and overruns indicate faulty flow control bad!
- These values are cumulative (since interface was up)
- Could put a load on interface to see current condition, with ping -1, to send large number of packets to destination
- See the difference in values

- ver. 1.4 Network Troubleshooting - p. 76/134

Traffic measurements: ifconfig, ip

• ifconfig and ip give more information than netstat -i:

```
Netstat -:
```

2140511920 1605768150 0

```
Link encap: Ethernet HWaddr 00:00:E2:35:AF:EE

```

SNM — ver. 1.4 Network Troubleshooting - p. 77/134 SNM — ver. 1.4 Network Troubleshooting - p. 78/134

Getting more info using ip

The -s (-statistics) option to ip provides statistics. Adding a second gives you even more:

S ip -s -s link list eth0 2: eth0: <BROADCAST, MULTICAST, UP> mtu 1500 qdisc pfifo_fast qlen 100 link/ether 00:00:e2:35:af:ee brd ff:ff:ff:ff:ff RX: bytes packets errors dropped overrun mcast 3070792102 407726727 0 0 RX errors: length crc frame fifo 0 0 TX: bytes packets errors dropped carrier collsns 2445799644 1606151878 0 0 TX errors: aborted fifo window heartbeat

Λ

3

SNM — ver. 1.4 Network Troubleshooting - p. 79/134

Quick Guide to using ip: set up routes

- \$ ip route add default dev eth1 via 192.168.0.254
- \$ ip route add 192.168.1.0/24 via 192.168.0.10
- The last adds a static route to another network
- the first adds the default route.
- You can omit the device if the network can be reached through a particular interface without any ambiguity
 - I.e., ip is smart enough to figure out which network device to use, though specifying it doesn't hurt.

Quick Guide to using ip: set up interface

- Here we set up a network interface and give it the IP address 192.168.0.1/24:
 - \$ ip link set dev eth1 up
 - \$ ip addr add 192.168.0.1/24 brd + dev eth1
- Two important points:
 - If you do not specify the netmask, a netmask of /32 is assumed
 - brd + means obtain broadcast address by setting the host bits

SNM — ver. 1.4 Network Troubleshooting - p. 80/134

Packet Capture

tcpdump, Ethereal and Ntop

SNM — ver. 1.4 Network Troubleshooting - p. 81/134 SNM — ver. 1.4 Network Troubleshooting - p. 82/134

What is Packet Capture?

- Real time collection of data as it travels over networks
- Tools called:
 - packet sniffers
 - packet analysers
 - protocol analysers, and sometimes even
 - traffic monitors

SNM — ver. 1.4

Network Troubleshooting - p. 83/134

Warning: Don't Get Sacked!

- Be sure that your boss agrees with you capturing packets on your company's network
- People have been sacked for doing this without permission!
- Some have suffered long lawsuits and criminal records:
 - See http://www.stonehenge.com/merlyn/, and http://www.lightlink.com/spacenka/fors/ for a famous example
- Do not invade the *privacy* of others
 - Capturing passwords with insecure protocols such as telnet, ftp, http (that is not encrypted with TLS) is very easy
 - DON'T DO IT!

When Packet Capture?

- Most powerful technique
- When need to see what client and server are actually saying to each other
- When need to analyse type of traffic on network
- Requires understanding of network protocols to use effectively

SNM — ver. 1.4

Network Troubleshooting - p. 84/134

tcpdump

- Available everywhere
- Windows: http://windump.polito.it/
- Syntax also used by other programs (such as Ethereal)
- Often it is the only tool available, so good to know
- Works by putting network interface into promiscuous mode
 - normal Ethernet interface will ignore packets not addressed to it
 - in promiscuous mode, will examine all packets that arrive, even those not addressed to it

SNM — ver. 1.4 Network Troubleshooting - p. 85/134 SNM — ver. 1.4 Network Troubleshooting - p. 86/134

How to use tcpdump

- Can just type its name (as root):
 - \$ sudo tcpdump
- ...but get a huge amount of data!
- Can restrict the data collected using a filter
- A filter may select addresses, protocols, port numbers, . . .

SNM — ver. 1.4

Network Troubleshooting - p. 87/134

tcpdump Filters: host and port

- Show all network traffic to and from 192.168.0.1:
 - \$ tcpdump host 192.168.0.1
- Show packets to 192.168.0.1:
 - \$ tcpdump dst 192.168.0.1
- Show packets to port 68 on 192.168.0.1:
 - \$ tcpdump dst 192.168.0.1 and port 68

tcpdump: some options

- -c $\langle n \rangle$ capture a count of $\langle n \rangle$ packets then stop
- **-w** $\langle file \rangle$ write raw data to $\langle file \rangle$.
 - Very useful can filter and analyse this later with tcpdump, ethereal or other tools
 - but you cannot see what you are capturing till later!
- -i $\langle interface \rangle$ collect from $\langle interface \rangle$ instead of lowest numbered network interface
- -s \(\delta bytes\)\) collect no more than \(\delta bytes\)\) of data from each packet instead of default 68 bytes
- -e show link level info, e.g., Ethernet addresses
- -x gives a hexadecimal dump of packets excluding link level data
- -x display ASCII as well as hexadecimal if have -x option too

tcpdump filters: networks

- Capture traffic to or from 205.153.60/24:
 - \$ tcpdump net 172.19.64/18
- can specify network as source or destination:
 - \$ tcpdump src net 205.153.60/24
 - \$ tcpdump dst net 172.19.64/18

SNM — ver. 1.4 Network Troubleshooting - p. 89/134 SNM — ver. 1.4 Network Troubleshooting - p. 90/134

tcpdump filters: protocol

- tcpdump ip
- tcpdump tcp
- tcpdump ip proto ospf
- This will catch DNS name lookups, but not zone transfers (which use tcp):
- tcpdump udp port 53

SNM — ver. 1.4 Network Troubleshooting - p. 91/134

Writing data to a file

\$ sudo tcpdump -c 1000 -w ~/tmp/tcpdump.pcap
tcpdump: listening on eth0
1014 packets received by filter
0 packets dropped by kernel

tcpdump filters: combining

- This will not work as you might expect:
- tcpdump host ictlab and udp or arp
- Instead, need group with parentheses, and quote:
- tcpdump "host ictlab and (udp or arp)"
- many more ways of filtering: man tcpdump

M — ver. 1.4 Network Troubleshooting - p. 92/134

Reading a Dumped File

```
$ tcpdump -nr ~/tmp/tcpdump.pcap arp
22:32:41.751452 arp who-has 172.19.127.254 tell 172.19.127.29

SNM — ver. 1.4 Network Troubleshooting - p. 93/134 SNM — ver. 1.4 Network Troubleshooting - p. 94/134

HTTP

\$ tcpdump -nr ~/tmp/tcpdump.pcap port http 22:43:32.633636 192.168.25.9.14075 > 172.19.64.52.http: S 1015952778:1015952778(0) win 6144 <mss 1460> (DF) 22:43:32.633693 172.19.64.52.http > 192.168.25.9.14075: S 1929920485:1929920485(0) ack 1015952779 win 5840 <mss 1460> (DF) 22:43:32.635828 192.168.25.9.14075 > 172.19.64.52.http: P 1:590(589) ack 1 win 6144 (DF) 22:43:32.635906 172.19.64.52.http > 192.168.25.9.14075: . ack 590 win 6479 (DF) 22:43:32.636758 172.19.64.52.http > 192.168.25.9.14075: P 1:217(216) ack 590 win 6479 (DF) 22:43:32.636982 172.19.64.52.http > 192.168.25.9.14075: F 217:217(0) ack 590 win 6479 (DF) 22:43:32.639080 192.168.25.9.14075 > 172.19.64.52.http: R 590:590(0) ack 217 win 0 (DF)

SNM — ver. 1.4 Network Troubleshooting - p. 95/134

Window

- win \(\langle nnn \rangle \) specifies data window the sending host will accept in future packets
 - I.e., the maximum number of bytes
- TCP flow-control:
 - host reduces this number if congested or overloaded
 - will sometimes set to 0 to temporarily halt incoming traffic in this connection

tcpdump: When reading TCP

- format:
- src > dst: flags data-seqno ack window urgent options
- Flags are some combination of S (SYN), F (FIN), P (PUSH) or R (RST) or a single '.' (no flags).
- The first time topdump sees a top 'conversation', it prints the sequence number from the packet.
- On subsequent packets of the conversation, the difference between the current packet's sequence number and this initial sequence number is printed.

SNM — ver. 1.4 Network Troubleshooting - p. 96/134

Ethereal
King of the Packet Analysers!
Available for Linux, Unix, Windows

SNM — ver. 1.4 Network Troubleshooting - p. 97/134 SNM — ver. 1.4 Network Troubleshooting - p. 98/134

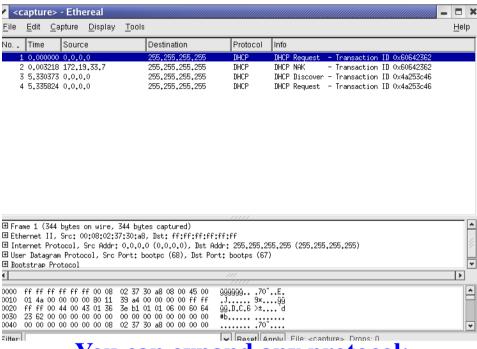

Ethereal

- Ethereal can read data captured by tcpdump, e.g.,
 \$ ethereal -r tcpdump.pca
- lacksquare or File o Open
- Can capture data itself
- Uses same filter language as tcpdump

Ethereal: Capture Options Capture Interface: eth0 Limit each packet to 68 bytes Capture packets in promiscuous mode Filter: port 67 or port 68 Capture file(s) File: Use ring buffer Number of files 2 Display options Update list of packets in real time ☐ Automatic scrolling in live capture Capture limits Stop capture after packet(s) captured Stop capture after 🚊 kilobyte(s) captured Stop capture after econd(s) Name resolution ☑ Enable MAC name resolution Enable network name resolution Cancel

SNM -- ver. 1.4

Network Troubleshooting - p. 99/134

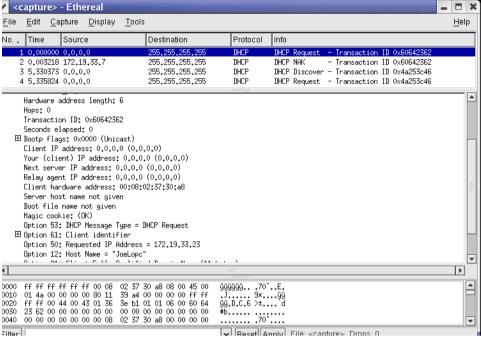

You can expand any protocol:

• If we click on the

mext to Bootstrap Protocol, we can see the details of the DHCP Request:

Network Troubleshooting - p. 101/134 SNM — ver. 1.4 Network Troubleshooting - p. 102/134

Tools \rightarrow **Follow TCP Stream**

- Can view the contents of an entire TCP stream conversation, in ASCII or in hexadecimal.
- Be careful not to invade your customers' privacy.
- Can use to check if a communications stream is really encrypted

Display Filters

- Note the box at the bottom of Ethereal for display filters
- Select only some of the packets captured for display
- see man ethereal and search for DISPLAY FILTER SYNTAX
- Different syntax than the syntax for capture filters
- Example:
- ip.src==172.19.64.52 and ip.dest==172.19.64.57

SNM — ver. 1.

Network Troubleshooting - p. 104/134

Ntop: monitoring data at a point

- The Ntop program:
 - listens on a network interface
 - puts an Ethernet interface into promiscuous mode and
 - displays statistics through a web interface
- Shows:
 - percentages of protocols,
 - which machines generate most traffic
 - which traffic is purely local, which traffic comes from outside, which traffic goes from inside to outside of network

SNM — ver. 1.4 Network Troubleshooting - p. 105/134 SNM — ver. 1.4 Network Troubleshooting - p. 106/134

Ntop: Installing

Installation is pretty easy. On my Fedora Core 1 machine:

```
$ rpmbuild --rebuild ntop-3.0-0.src.rpm
$ sudo rpm -Uhv /home/nicku/RPM/RPMS/i386/ntop-3.0-0.i386.rpm
$ ls -l /etc/ntop.conf*
-rwx------ 1 root root 13203 Apr 27 03:47 /etc/ntop.conf.sample
$ sudo cp -a /etc/ntop.conf.sample /etc/ntop.conf
$ sudo emacs /etc/ntop.conf &
# temporarily comment out the line --daemon
$ sudo /usr/bin/ntop @/etc/ntop.conf -A
$ sudo service ntop start
```

Then open the web browser on

http://localhost:3000/

SNM — ver. 1.4

Network Troubleshooting - p. 107/134

Port Monitoring: Switched Networks

Problem:

- a switched network is really a point-to-point network
- You cannot normally capture the unicast traffic from other hosts on a single switch port
- How do you use Ethereal, tcpdump or Ntop to monitor traffic between a number of hosts?

Solution: many switches support *port monitoring*, where one port can monitor all traffic on a specified VLAN

Example:

- Cisco 3500XL switches provide the port monitor command:
- port monitor vlan VLAN1

Switched Networks

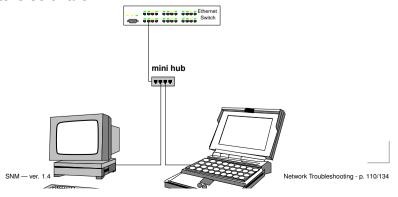

Using Ethereal, tcpdump, Ntop in a switched network

SNM — ver. 1.

Network Troubleshooting - p. 108/134

How monitor one machine?

- You are asked to check out a server on a switched network: The switch does not support port monitoring (§109), or you do not have administrative access to the switch: what to do?
- Use a small hub, and use a notebook running the capture software

SNM — ver. 1.4 Network Troubleshooting - p. 109/134

Are switched networks secure?

- Is all unicast traffic on one port of a switch private?
- No, there are tools (dsniff and Ettercap) freely available to automate ARP spoofing and man-in-the-middle attacks, that provide various ways to compromise switch security.

SNM — ver. 1.4 Network Troubleshooting - p. 111/134

What is a port scanner?

- Sends packets to various ports on a network device
- Best one available everywhere is nmap
- can identify the OS of the target machine
- Do not port scan arbitrary machines in your company's network without permission!
- May be interpreted as a cracking attempt

Port Scanning

SNM — ver. 1.4

Network Troubleshooting - p. 112/134

How does nmap identify OS?

- RFCs leave interpretation of some things up to the implementer
- RFCs do not specify how should work if get contradictory flags, strange sequences of inconsistent packets
- Most TCP/IP implementations are not complete
- Every implementation of TCP/IP is different; the "grey areas" are different from one OS to another.
- nmap sends "strange" packets to the machine, detects how reacts, matches this against a file of OS fingerprints

SNM — ver. 1.4 Network Troubleshooting - p. 113/134 SNM — ver. 1.4 Network Troubleshooting - p. 114/134

Running nmap: Use xnmap

- \$ sudo -v
- \$ sudo xnmap &
- Enter the IP address of machine(s) to identify
- select other choices from buttons
- press Start
- xnmap is simply a way to easily generate command line options to nmap using a graphical interface

SNM — ver. 1.4 Network Troubleshooting - p. 115/134

DNS troubleshooting

Troubleshooting DNS Servers

Uses of nmap

- Identify the type of a computer that is causing trouble on the network
- Check what network services a computer is really offering
 - compare with netstat -tua output
 - A cracked computer may be hiding some services with trojaned utilities
 - nmap can help you discover such services

SNM — ver. 1.4

Network Troubleshooting - p. 116/134

DNS troubleshooting

- Suspect DNS when get long timeouts before see any response
- ping name, IP address, see if only IP address works
- tools on Linux, Unix:
 - dig, nslookup, host
- tools on Windows:
 - nslookup

SNM — ver. 1.4 Network Troubleshooting - p. 117/134 SNM — ver. 1.4 Network Troubleshooting - p. 118/134

DNS: dig

- The people who write the most common name server (Bind) promote dig, deprecate nslookup
- dig output is in form of DNS resource records
 - can copy and paste straight into DNS database files

SNM — ver. 1.4 Network Troubleshooting - p. 119/134

dig: reverse lookup 1

```

dig syntax

```
dig [⟨options⟩] [@⟨server⟩] ⟨name⟩ ⟨type⟩
```

- main option is -x
- \(\server \rangle \) is the name server to query
 \(\)
 - by default, use first server in /etc/resolv.conf
- \(\lambda \) name \(\rangle \) is what you want to look up
 \(\lambda \)
- ⟨type⟩ can be: any, a, mx, axfr, soa, etc.
- default is to get A record(s)

SNM — ver. 1.4 Network Troubleshooting - p. 121/134 SNM — ver. 1.4 Network Troubleshooting - p. 122/134

dig: axfr (Zone Transfer)

dig can request a complete zone transfer:

```
$ dig @ns tyict.vtc.edu.hk axfr
```

```

telnet: Testing Other Applications

- Many network protocols are text. telnet can be helpful in checking:
 - IMAP servers:
 - \$ telnet \(\text{hostname} \) 143
 - Web servers:
 - \$ telnet \(\langle \text{hostname} \rangle 80\)
 - Ftp servers:
 - \$ telnet \(\text{hostname} \) 21
 - Even ssh (can check version, if responding):
 - \$ telnet \langle hostname \rangle 22

pop3 commands: retrieving mail

- See RFC 1939 for easy-to-read details
- First, must authenticate:

```
user \langle username \rangle
pass \langle password \rangle
```

stat shows number of messages and total size in bytes

list list all the message numbers and size in bytes of each message

retr \langle messagenum \rangle retrieve the message with number \langle messagenum \rangle

dele \langle messagenum\rangle delete the message with message number \langle messagenum\rangle

_quit

SNM - ver. 1.4

Network Troubleshooting - p. 132/134

Conclusion

- Check the simple things first
- Be methodical
- Document what you do
- Become familiar with common tools
- Use the tools to become familiar with your network before troubles strike
- Know what is "normal"
- Getpermission from the boss before using packet sniffing and port scanners

SNM — ver. 1.4 Network Troubleshooting - p. 133/134 SNM — ver. 1.4 Network Troubleshooting - p. 134/134
