1.111.4 Automate system administration tasks by scheduling jobs to run Weight 4

Linux Professional Institute Certification — 102

Geoff Robertson <ge@ffrey.com>

Nick Urbanik <nicku@nicku.org>

2005 July

Description of Objective

Candidate should be able to use cron or anacron to run jobs at regular intervals and to use at to run jobs at a specific time. Task include managing cron and at jobs and configuring user access to cron and at services.

Key files, terms, and utilities include:

/etc/anacrontab
/etc/at.deny
/etc/at.allow
/etc/crontab
/etc/cron.allow
/etc/cron.deny
/var/spool/cron/*
at
atq
atrm
crontab

111.4 Scheduling jobs [4] Key files, terms and utilities
crontab at
/etc/anacrontab atq
/etc/crontab /etc/at.deny
/etc/cron.allow /etc/at.allow
/etc/cron.deny
_/var/spool/cron/*

Basically

at - Run a command once

cron-Run a command periodically

The at $\ensuremath{\mathsf{command}}$

at takes a time and a list of commands to run. Any output to STDOUT or STDERR will be mailed to the user running at.

```
$ at 2pm \leftrightarrow \setminus
warning: commands will be executed using /bin/sh
at> date \leftrightarrow \setminus
at> ^D \leftrightarrow \setminus
job 3 at 2002-05-08 14:00
```

The at command

The current umask, working directory and environment (except for TERM, DISPLAY and _) are saved and restored before running the job (unlike cron).

The commands to run will be read from STDIN or from a file given with -f. Example at time specifications at allows a *very* flexible time format.

17:36 Run at 5:36pm today or tomorrow.

9pm May 8 Run at 9pm on May 8th.

noon tomorrow Run at 12pm tomorrow.

3

now + 2 hours Run in 2 hours.

See at(1) for more details. 2 Oueued jobs atq lists a user's pending jobs.

```
atq \leftarrow \land
A3
            2002-05-08 14:00 a gus
```

\$ **atrm B3** \leftarrow removes the queued job.

\$ at $-c C3 \leftarrow dumps the job on STDOUT.$

crontab

cron is a daemon that reads everyone's crontab information, spawning new tasks at the appropriate times.

crontab *file* Replace your crontab file with *file*.

crontab -1 List your crontab.

crontab -r Remove your crontab.

crontab -e Edit your crontab (with \$EDITOR).

6 crontab file format A sample crontab file:

```
min0 hr7 dom1 monjan wild*\
echo "sleep in, you dont feel so good"
```

```
comment# gratuitous noise\
0 17 * * dowmon,wed,fri
```

stdinwall%meeting in 5 minutes%\

0 9-18step/2 * * rangemon-fri

env\$HOME/bin/cron.bihourly

*2commentXLine based, hash comments, ignored blank lines, etc [linecolor=red,angleA=270,au commentcommentX

cron from root

A few extra issues arise when editing /etc/crontab (and similar "system" crontab files):

Don't use crontab -e, edit /etc/crontab directly.

A new column (after timespec, before command) gives the user to the command run as.

Distributions often create directories for "common" frequencies. It usually makes much more sense to place a script in there, rather than adding your own crontab lines.

Debian (for example) runs any scripts in /etc/cron. {daily, weekly, monthly} - but these are triggered from normal entries in /etc/crontab, so there's no real mystery here.

(Debian specific?) /etc/cron.d/* is read in addition to /etc/crontab (they also have the extra user field).

anacron

Apparently some people turn their machines off.

If your computer is always turned off at night (for example), then daily jobs which are usually scheduled to run in the wee hours, will never be run. This is a problem.

*3

anacron fixes this by running any missed jobs after a reboot (or other times, like AC-on for laptops).

anacron

Since anacron can't use the crontab files, it has its own simplified /etc/anacrontab.

If you only use the standard /etc/cron.daily, monthly, weekly, then no further configuration will be necessary. Otherwise, see <u>anacrontab(5)</u>.

Note that the frequency of anacron jobs can only be specified in days.
